

Towards Modeling Conceptual Dependency Primitives with Image Schema Logic

Jamie Macbeth, Dagmar Gromann
JOWO 2019
Graz, Austria, 23.09.2019

Image Schemas (IS)

Image schema is “a recurring dynamic pattern of our perceptual interaction and motor programs that gives coherence and structure to our experience” (Johnson 1987, xiv)

Image Schema

Physical Experience

Metaphor

Example

CONTAINMENT

CONTAINER FOR
CONTAINED

go for a glass, the
whole town
participated

PATH

LIFE IS A
JOURNEY

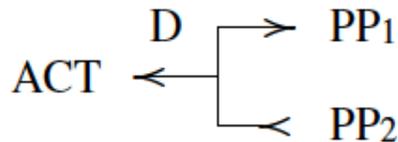

to be on track,
career path, life path

Conceptual Dependency (CD)

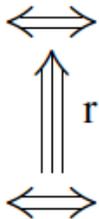

Conceptual dependency is a “theory of human natural language understanding” (Schank 1972, 552) and provides a “representation of the conceptual base that underlies all natural language (Schank 1972, 554).

CD Construct

PP \Leftrightarrow ACT

PP \longleftrightarrow PA

Description

A picture producer (PP; physical object) is in a two-way dependency relation with an ACT (conceptual primitive done by actor to an object or events that can happen to an object).

Conceptualization with a direction case (PP2 = origin; PP1 = destination).

Picture aider (PA) describe PPs and are state predicates that take the form STATE(VALUE), e.g. CONTAIN(x)

Result causation connective that indicates that one event or act resulted in another.

CD primitives

Conceptual dependency (CD) has numerous primitives used to represent thought, perception, social interaction, and communication. Our focus: physical, spatial, and object-defining primitives.

| CD Primitive | Description | Example |
|--------------|--|--|
| PTRANS | A person, object, or thing changes physical position or location. | “Matthew flew come from LA.” Matthew \longleftrightarrow PTRANS |
| INGEST | A change in spatial relationship between two picture producers (PP1 and PP2) beginning with PP1 being on the outside of PP2, and ending with PP1 being on the inside of PP2. | “Amy took a deep breath.” Amy \longleftrightarrow INGEST |

IS vs. CD

- spatio-temporal relationships connecting sensorimotor experiences with high-level conceptualization
- objective: inventory of structures to organize meaning at more abstract levels of cognition in form of metaphorical projections
- abstract, gestalt structures, non-propositional
- conceptual basis, i.e., conceptual dependency primitives, with concepts and relations that is interlingual
- objective: map compositional varieties of natural language sequences onto abstract, unambiguous base forms (CD primitives)
- abstract, conceptual, propositional

abstract representation of physical experiences

Existing mapping

| CD Primitive | Related Image Schema(s) | Related Spatial Primitives |
|--------------|--------------------------------------|---|
| PTRANS | SOURCE_PATH_GOAL | SOURCE, GOAL, PATH, MOVE, DIRECTION |
| MOVE | SOURCE_PATH_GOAL, PART-WHOLE | SOURCE, GOAL, PATH, MOVE, DIRECTION, PARTS, WHOLE, |
| GRASP | SUPPORT | ATTRACTION, COMPULSION |
| PROPEL | FORCE | CONTACT |
| INGEST | SOURCE_PATH_GOAL, CONTAINMENT, FORCE | IN, BOUNDARY, CONTAINER, SOURCE, GOAL, PATH, MOVE, DIRECTION |
| EXPEL | SOURCE_PATH_GOAL, CONTAINMENT, FORCE | OUT, BOUNDARY, CONTAINER, SOURCE, GOAL, PATH, MOVE, DIRECTION |
| PP | OBJECT | |
| PART | PART-WHOLE | PARTS, WHOLE, CONFIGURATION |
| CONTAIN | CONTAINMENT | CONTAINER, IN, OUT, BOUNDARY |

(Macbeth et al. 2017)

Crowdsourcing

- Replicating a crowdsourcing experiment conducted for CD (Macbeth and Barionnette 2016) for image schemas (Gromann and Macbeth 2019) with the same set of sentences
- Compare CD primitives and image schemas utilized to annotate the same sentence
- Largely confirmed expert mapping of CD and IS

Motivation

- Based on this previous mapping, utilize image schemas and more specifically an existing Image Schema Logic (ISL^M) to formalize CD primitives
- Goal of CD: provide minimal set of necessary abstract constructs, “conceptualizations”, to capture meaning in natural language => we want to contribute by checking current physical CD primitive inventory based on formalization for consistency and overlap

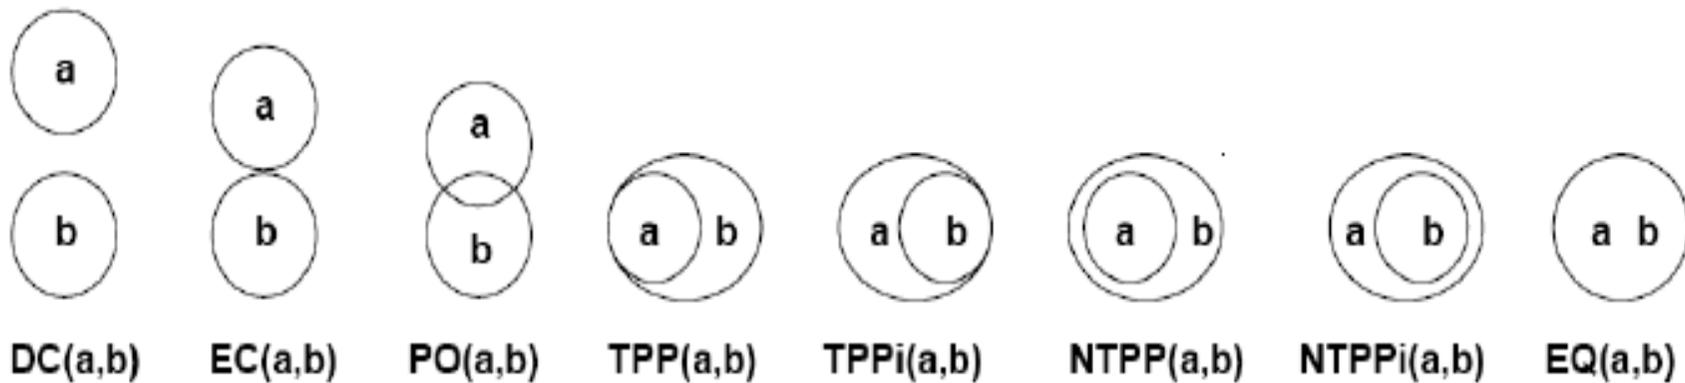

Image Schema Logic (ISL^M)

Three dimensions required to capture image schemas:

- Spatial
- Movement
- Temporal

Spatial ISL^M

- Regional Connection Calculus 8 (RCC-8)
(Randell et al. 1992)

Movement ISL^M

- Qualitative Trajectory Calculus (QTC)
(Van de Weghe et al. 2006)

- Simplified as:

Move towards

$$O_1 \rightsquigarrow O_2$$

Move away from

$$O_1 \leftrightsquigarrow O_2$$

No relative movement

$$O_1 |o O_2$$

Temporal ISL^M

- Linear Temporal Logic (LTL)
 - $F\varphi$ (at sometime in the future, φ) is defined as $\top U \varphi$,
 - $G\varphi$ (at all times in the future, φ) is defined as $\neg F \neg \varphi$.

Modeling CD primitives in ISL^M

CD Primitive

ISL^M

PTRANS

$\text{On_PATH_Toward}(O_1, O_2) :=$
 $(O_1 \rightsquigarrow O_2 \wedge DC(O_1, O_2))$

$\text{On_PATH_From}(O_1, O_2) :=$
 $(O_1 \leftarrow O_2 \wedge DC(O_1, O_2))$

MOVE

$\text{Move_Toward}(O_1, O_2, O_3) :=$
 $PP(O_1, O_2) \wedge$
 $\text{On_PATH_Toward}(O_1, O_3)$

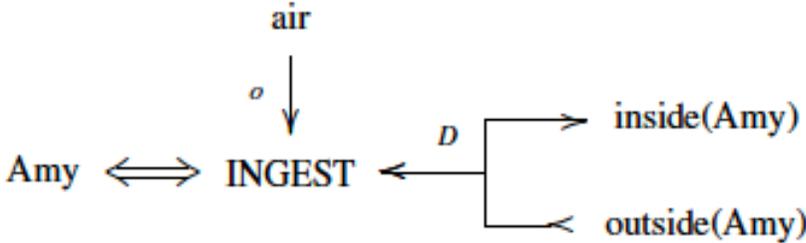

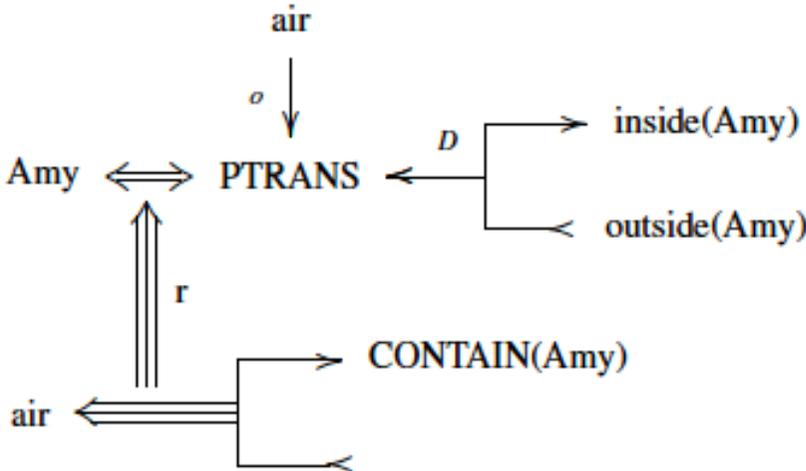

$\text{Move_From}(O_1, O_2, O_3) :=$
 $PP(O_1, O_2) \wedge$
 $\text{On_PATH_From}(O_1, O_3)$

CONTAIN

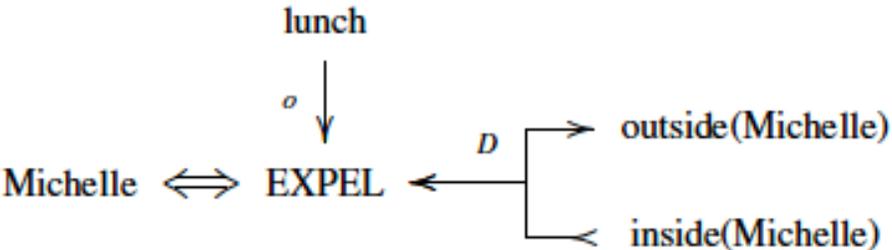

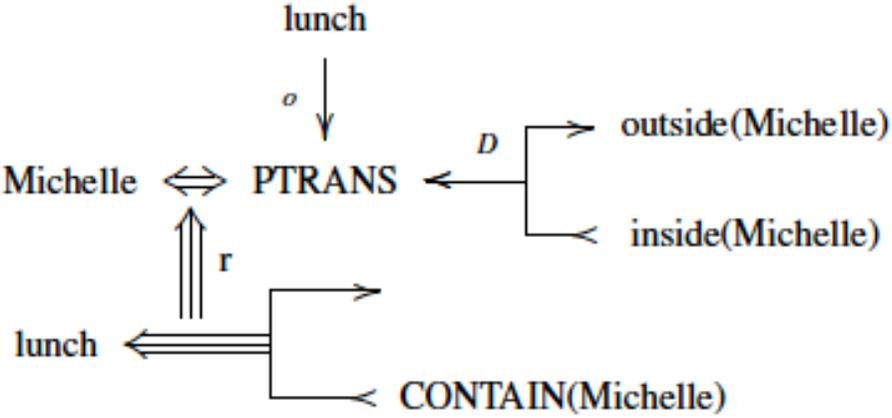

$\text{Contained_Inside}(O_1, O_2) :=$
 $\text{inside_of}(in, O_2) \wedge PP(O_1, in)$

$\text{Crossing_Opening}(O_1, O_2, opening) :=$
 $\text{opening_of}(opening, O_2) \wedge$
 $(DC(O_1, O_2) \wedge \text{On_PATH_Toward}(O_1, opening)) \wedge$
 $\mathbf{F}(PO(O_1, opening))$

INGEST in ISL^M

| CD Diagram | ISL ^M |
|---|--|
|  <p>A CD diagram for the action INGEST. It shows a central node 'INGEST' with a double-headed arrow to 'Amy' on the left. Above 'INGEST' is the label 'air' with a downward arrow labeled 'o'. To the right of 'INGEST' is a bracket labeled 'D' that branches into two arrows: one pointing right to 'inside(Amy)' and one pointing left to 'outside(Amy)'.</p> | $\text{Going_IN}(\text{air}, \text{Amy}, \text{mouth}) :=$ $\text{Crossing_Opening}(\text{air}, \text{Amy}, \text{mouth}) \wedge$ $\text{F}(\text{Contained_Inside}(\text{air}, \text{Amy}))$ |
|  <p>A CD diagram showing two related actions. The top part is identical to the INGEST diagram, with 'PTRANS' instead of 'INGEST'. Below this, there is a node 'CONTAIN(Amy)'. A double-headed arrow labeled 'r' connects 'PTRANS' to 'CONTAIN(Amy)'. From 'CONTAIN(Amy)', two arrows branch out: one pointing right and one pointing left, both labeled 'air'.</p> | $\text{Going_IN}(\text{air}, \text{Amy}, \text{mouth}) :=$ $\text{Crossing_Opening}(\text{air}, \text{Amy}, \text{mouth}) \wedge$ $\text{F}(\text{Contained_Inside}(\text{air}, \text{Amy}))$ |

EXPEL in ISL^M

| CD Diagram | ISL ^M |
|--|---|
|  <p>Michelle \longleftrightarrow EXPEL</p> <p>lunch $\xrightarrow{\sigma}$ EXPEL</p> <p>D $\left\{ \begin{array}{l} \rightarrow \text{outside(Michelle)} \\ \leftarrow \text{inside(Michelle)} \end{array} \right.$</p> | $\text{Going_OUT}(\text{lunch}, \text{Michelle}, \text{mouth}) :=$ $\text{Contained_Inside}(\text{lunch}, \text{Michelle}) \wedge$ $\text{F}(\text{Crossing_Opening}(\text{lunch}, \text{Michelle}, \text{mouth}) \wedge$ $\text{F}(\text{outside_of}(\text{lunch}, \text{Michelle})))$ |
|  <p>Michelle \longleftrightarrow PTRANS</p> <p>lunch $\xrightarrow{\sigma}$ PTRANS</p> <p>D $\left\{ \begin{array}{l} \rightarrow \text{outside(Michelle)} \\ \leftarrow \text{inside(Michelle)} \end{array} \right.$</p> <p>lunch \xleftarrow{r} $\left\{ \begin{array}{l} \rightarrow \text{CONTAIN(Michelle)} \\ \leftarrow \end{array} \right.$</p> | $\text{Going_OUT}(\text{lunch}, \text{Michelle}, \text{mouth}) :=$ $\text{Contained_Inside}(\text{lunch}, \text{Michelle}) \wedge$ $\text{F}(\text{Crossing_Opening}(\text{lunch}, \text{Michelle}, \text{mouth}) \wedge$ $\text{F}(\text{outside_of}(\text{lunch}, \text{Michelle})))$ |

Observations

- EXPEL and INGEST (CD) are special cases of CONTAINMENT and SOURCE_PATH_GOAL (IS)
- represent a composition of PTRANS, CONTAIN, and DIRECTION
- potential to reduce the number of CD primitives in the inventory utilized to abstractly formalize natural language meaning

Conclusions

- Abstract formalization facilitates the mapping between two cognitive meaning representation theories
- and the checking of the consistency and potential redundancies in the inventory of CD primitives
- ISL^M and its dimensions are adequate to model physical, spatial, and object-defining CD primitives - how about other CD primitives?
